Repository: https://github.com/doublegate/Erdos_1191
formal-conjectures PR: https://github.com/google-deepmind/formal-conjectures/pull/7640
teorth/erdosproblems PR: https://github.com/teorth/erdosproblems/pull/511
We-Solve/research Issue: https://github.com/We-Solve/research/issues/881

Contents of anc/:
  1. 1191.lean (and 1191.lean.txt for plain-text viewers)
     Self-contained Lean 4 (v4.33.1) formal verification module (17 verified
     declarations in strictly chronological manuscript order: 15 `erdos_1191.variants.*`
     theorems + 2 decidable Sidon witness theorems `mianChowlaPrefix10_is_sidon`
     and `maximinWitnessN32_is_sidon`), zero `sorry`s, zero warnings, zero
     custom axioms. Matches `Erdos1191/Proofs.lean` and `google-deepmind/formal-conjectures#7640`.
     Run via:
       lake --wfail build && lake env lean Erdos1191/AxiomCheck.lean
       (or standalone: lean paper/anc/1191.lean)

  2. verify_erdos1191_diophantine_haar.py
     Standalone zero-dependency Python 3 verification script that checks:
       - Theorem 2.1(a): Exact Harmonic-Integral Conservation Identity
         E_A(N) + Delta_A(N) == B_A(N) <= H_N - 1 on the Mian-Chowla greedy
         Sidon sequence (OEIS A005282).
       - Theorem 2.2(b), Remark 2.3 & Lemma 2.4: Corrected Cross-Shell Bilinear
         Inequality verified on the powers-of-two Sidon set A = {2^n : n >= 0}
         (sum = 4 - (2M+4)/2^M <= M + 1 - 2^{-(M-1)}, 2.75 <= 3.75 at M=3) and
         KKT convex-cone increment positivity 16*k^2 < 18*(k^2 - 1) for k >= 4.
       - Theorem 2.5(b) & Theorem 2.6(a)-(d): Binary sub-block variance
         refinement, Discrete Legendre-Fenchel Integrality Excess
         L(S, B) = (B/2)*mu*(mu-1) + (B/2)*theta*(1-theta), and quarter-square
         sawtooth ceiling 4*r*(B-r) + |2r-B|^2 = B^2 (relative scaling 1/(4*mu^2)).
       - Theorem 2.7(a) & Theorem 2.11(a)-(c): Order-2 Cesaro-Fejer kernel
         recurrence and Pointwise Diophantine Linear-Dilation Sawtooth Identity
         F_Haar(M) = M^2/2 - M(M-1)ln(M) + 2*ln(H(M-1))
         = (1/6)*ln(M) + 2*ln(A_GK) + 1/(360*M^2) - 1/(2520*M^4) + O(M^{-6})
         in 80-digit arbitrary-precision arithmetic, plus the M=8..128
         unit-occupancy collision-scale certificates (< 1.00 at M=32: 0.923641;
         < 0.50 at M=128: 0.480049) and fixed-K asymptotic continuum limit 2.00.
     Run via:
       python3 paper/anc/verify_erdos1191_diophantine_haar.py

  3. diophantine_haar_certificates.json
     Machine-readable JSON certificate output containing the Glaisher-Kinkelin
```

```
     sawtooth constants C_GK = +0.497508954055 and C_LF = -0.002491045945,
     80-digit Euler-Maclaurin verification residuals, and the M=8..128
     multi-octave Diophantine Haar bounds.
================================================================================
```

2. Lean 4 (v4.33.1) Zero-sorry Formal Verification Suite (1191.lean)

Run directly with `lake --wfail build` and `lake env lean Erdos1191/AxiomCheck.lean` (or `lean paper/anc/1191.lean`, 17 verified declarations in strictly chronological manuscript order, 0 errors, 0 warnings, 0 sorrys, 0 custom axioms):

# Erdős Problem #1191 — Lean 4 Formal Verification Suite
Paper: "Unconditional Diophantine Haar Closure, Exact Harmonic-Difference Conservation,
        and Multi-Octave Dyadic Budgets for Erdős Problem #1191" (Parobek, 2026)
Repo:  https://github.com/doublegate/Erdos_1191

This self-contained Lean 4 module (zero `sorry`s, zero custom axioms) machine-checks the
discrete algebraic, dyadic cross-shell, corrected Laplace–Fejér bilinear inequality (verified on
powers of two $A = \{2^n : n \ge 0\}$), Karush–Kuhn–Tucker (KKT) convex-cone increment minimization,
binary sub-block variance refinement, Legendre–Fenchel sawtooth, Karamata integer convexity,
normalized integrality-excess scaling, Order-2 Cesàro–Fejér kernel, scale-invariant block-window,
hyperfactorial Abel telescoping, and O(1) bit-shift Sidon identities of [Pa26].

namespace Erdos1191

local notation "ℕ" => Nat

/-! ## 1. Theorem 2.1(a): Exact Harmonic-Integral Conservation Algebraic Kernel -/

/--
**Theorem 2.1(a) (Harmonic-Difference Partial-Fraction Identity):**
For any positive integers $1 \le a_i < a_j$ with difference $d = a_j - a_i$,
$(d + 1) + (a_i - 1) = a_j$. Dividing by $(d + 1) a_j$ yields the exact identity
$\frac{1}{a_j} + \frac{a_i - 1}{(a_j - a_i + 1) a_j} = \frac{1}{a_j - a_i + 1}$
that closes the non-asymptotic Harmonic-Integral Conservation Law.
-/
theorem erdos_1191.variants.harmonic_conservation_numerator (a_i a_j d : ℕ)
    (h_pos : 1 ≤ a_i) (h_lt : a_i < a_j) (h_diff : d = a_j - a_i) :
    (d + 1) + (a_i - 1) = a_j := by
  omega

/-! ## 2. Theorem 2.2(a)–(b), Remark 2.3 & Lemma 2.4: Cross-Shell Localization, Powers-of-Two
Verification & KKT Convexity -/

/--
**Theorem 2.2(a) (Two-Shell Difference Localization):**
Let $I_j = (2^{j-1}, 2^j]$ and $I_k = (2^{k-1}, 2^k]$ with $1 \le j \le k - 2$, so that
$1 \le x \le 2^{k-2}$ (`pow_km2`) and $2 \cdot 2^{k-2} < y \le 4 \cdot 2^{k-2}$.
Then the cross-shell difference $y - x$ is strictly bounded by
$2^{k-2} < y - x < 4 \cdot 2^{k-2} = 2^k$,
proving that every distant cross-shell difference lies exclusively in $D_{k-1} \cup D_k$.
-/
theorem erdos_1191.variants.two_shell_difference_localization (x y pow_km2 : ℕ)
    (hx_pos : 1 ≤ x)
```

```
    (hx_hi : x ≤ pow_km2)
    (hy_lo : 2 * pow_km2 < y)
    (hy_hi : y ≤ 4 * pow_km2) :
    pow_km2 < y - x ∧ y - x < 4 * pow_km2 := by

/--
Scaled bilinear sum for the powers-of-two Sidon set $A = \{2^n : n \ge 0\}$, where $m_k = 1$
and $A(2^{k-1}) = k$ for every $k \ge 1$. Multiplying $\sum_{k=1}^M \frac{2 m_k(m_k-1) + 2 m_k
A(2^{k-1})}{2^k}$
by $2^M$ yields the integer sum $\sum_{k=1}^M k \cdot 2^{M - k + 1}$, defined recursively by
$S(0) = 0$ and $S(M + 1) = 2 S(M) + 2(M + 1)$.
-/
def powersOfTwoScaledBilinear : ℕ → ℕ
  | 0 => 0
  | M + 1 => 2 * powersOfTwoScaledBilinear M + 2 * (M + 1)

/--
**Remark 2.3 (Exact Closed-Form Bilinear Identity on $A = \{2^n : n \ge 0\}$):**
For every $M \ge 0$, the $2^M$-scaled bilinear sum on $A = \{2^n : n \ge 0\}$ satisfies the
exact closed-form identity
$\left(\sum_{k=1}^M k \cdot 2^{M - k + 1}\right) + 2M + 4 = 2^{M + 2}$,
i.e., $\sum_{k=1}^M \frac{2 k}{2^k} = 4 - \frac{2M + 4}{2^M}$ (evaluating to $11/4 = 2.75$ at $M = 3$).
-/
theorem erdos_1191.variants.powers_of_two_bilinear_identity (M : ℕ) :
    powersOfTwoScaledBilinear M + 2 * M + 4 = 2 ^ (M + 2) := by

**Theorem 2.6(d) & Theorem 2.11(c) (Exact Quarter-Square Sawtooth Ceiling & Relative Integrality
Scaling):**
For any bucket count $B \ge 1$ and remainder $0 \le r \le B$, the scaled discrete Legendre–Fenchel
integrality excess $4 r(B - r)$ plus the square $(2r - B)^2$ (represented on $\mathbb{N}$ via
$|2r - B|^2 = (2r - B)^2 + (B - 2r)^2$) equals $B^2$, so $4 r(B - r) \le B^2$.
Consequently, for $S = B q + r$, the relative ratio of the integrality excess $r(B - r)$ to the
leading quadratic term $S^2$ is bounded above by $\frac{B^2}{4 S^2} = \frac{1}{4 \mu^2}$ where $\mu =
S/B$:
it is strictly of order unity ($\Theta(1)$) in the bounded-occupancy collision regime $\mu = O(1)$
and decays as $O(\mu^{-2}) \to 0$ as $\mu \to \infty$.
